SECTION 8
INSTRUCTION MANUAL FOR SPECIAL FUNCTIONS

Introduction

The MDP-V8K is provided with special functions, in addition to its normal functions, for convenience in maintenance and repair work.
In this manual, these functions are classified into three sections-"Debug Mode", "Service Mode", and "Expansion Key Mode" and explained.
The specifications given in this manual are subject to change without prior notice for upgrading, etc.

CONTENTS

1. OUTLINE

1-1. Debug Mode

The "Debug Mode" is a state in which the function (debug function) which displays microprocessor RAM information on the screen can be used.

This mode differs from the normal mode as follows.

1) The FL tube goes off when the commands of this mode are effective.
2) When the key of the remote control is pressed in the state of 1), debug information such as emergency history, etc., can be displayed. During this time, only some keys will be effective.

1-2. Service Mode

The "Service Mode" is a state in which the function (service function) which facilitates repairs and inspections can be used.

This mode differs from the normal mode as follows.

1) Special operations such as focus search, sled forwarding, etc. can be performed.
2) The power will not go off automatically even when emergencies which turn off the power occur.
3) When this mode is set, the debug mode will also be set automatically.

1-3. Expansion Key Function

The "Expansion Key Function" is the function which operates when several keys of the unit or remote control are pressed simultaneously for tests, etc. according to a set of procedures.

This function can be used in the service mode, debug mode, and in normal operations.

This function consists of the "Unit Key Simultaneous Pressing Function" used by pressing several keys of the unit simultaneously and the "Unit Key+Remote Control Key Simultaneous Pressing Function" used by pressing the unit key together with a key of the remote control twice.

2. DEBUG MODE

2-1. Setting the Debug Mode

To set the debug mode from the normal mode (normal state), press the [0] key and then the [STOP] key of the remote control while pressing the [NEXT DISC RESERVE] key of the unit with the power on.

The following screen should be displayed.

This screen shows the microprocessor version. For details, refer to "2-4-1. Microprocessor Version".

While in the debug mode, the [NEXT DISC RESERVE] key will operate as the debug mode ON/OFF key. The FL tube will be off while debug commands are effective. Debug commands will also be effective when the background color is green (during STOP, PAUSE, etc.)(During the service mode, it will be purple.)

The [NATURAL] key can be used instead of the [NEXT DISC RESERVE] key.

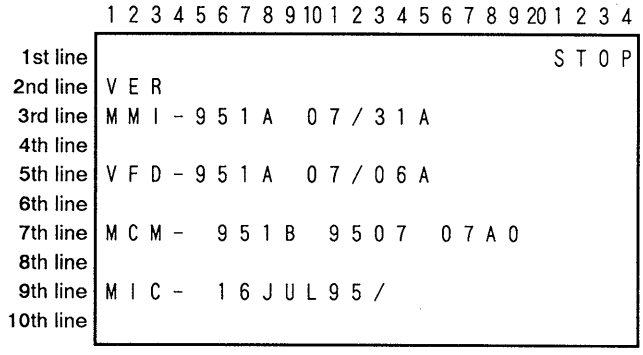

Fig. 8-1. Debug Mode Initial Screen

2-2. Exiting the Debug Mode

To return to the normal mode from the debug mode, press the [CLEAR] key of the remote control at the screen shown in Fig. 8-1. (Microprocessor Version Screen).

Pressing this key as described in step 2-1 will also return the normal mode.

In the normal mode, the [NEXT DISC RESERVE] key will perform only its usual functions.

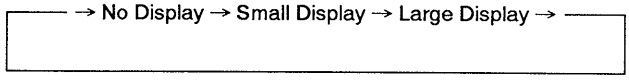
2-3. Switching the Screen Display

When the debug mode is set, the screen will display the "Debug Screen".

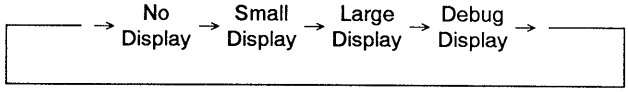
Press the [DISPLAY] key will switch it to the display format as in the normal mode.

In the debug mode, the display format can be selected from "No-Display" (normally nothing is displayed), "Small Display" (only the first line displayed)", "Large Display" (the whole screen is displayed constantly), and "Debug-Display".

When the [DISPLAY] key is pressed in the normal mode, the display will be switched as follows.



In the debug mode, it will be switched as follows



2-4. Reading the Debug Display

"Debug Display" shows information of the mode controller on the screen in dump list format.

The title is displayed at the left side of the screen at the second line, while the data is displayed from the third to the ninth lines.

The display format of the data is basically 4 hexadecimal characters (2 bytes) equals one set, and one line is composed of up to four sets (8 bytes).

When a certain key is pressed while the FL tube is off during "Debug Display", the information to be displayed can be selected.

The information currently defined is as follows.

2-4-1. [FRAME/TIME] Microprocessor Version

Displays the microprocessor version.

At the same time, displays the c-cube microprocessor cord version.

The third line displays the mode controller version, the fifth line displays the VFD controller version, and the seventh line displays the mechanism controller version.

The microprocessor cord version is displayed at the ninth line.

According to the example in Fig. 8-2, the mode controller version is "MMI-951A 07/31A), the VFD controller version is "VFD-951A 07/06A), the mechanism controller version is "MCM-951B 95/07/07A0), and the microprocessor cord version is "16JUL95".

2-4-2. [1] Function Mode History

Displays the history of the function mode.

The function mode is the basic operation commands, such as STOP and PLAY, which are transmitted from the mode controller to the mechanism controller.

The function mode data is one byte each (hexadecimal 2 digits). 8 latest histories of the function mode can be stored at the one line, and up to 24 histories in three lines.

The data is stored byte by byte from left to right. The data [FF] is stored next to the last data stored. When the data reaches the right edge of the first line, it is stored from the left edge of the second line continuously. When it reaches the right edge of the third line, it returns to the left edge of the first line again.

The current (stored last) function mode is the data at the left side of the data [FF]. When this data [FF] is at the left edge of the first (second, third) line, the function mode will be the data at the right edge of the third (first, second) line.

The data [FE] indicates that an emergency has occurred there. To find out the type of emergency, refer to "2-4-3. Emergency History".

2-4-3. [2] Emergency History

Displays the history of emergency codes occurred.
The emergency code is 1 byte data transmitted to the mode controller when problems occur in the mechanism controller.
Like [64 (Minimum chapter detection)], some codes only indicate the state code level. Codes above [HO] are generated in the mode controller itself and are not transmitted from the mechanism controller.
If emergency has not occurred once since the power cord was inserted in the outlet, all the data will be [00].
The display format is the same as the function mode history. 16 sets are stored in 2 lines. The emergency code immediately before the data [FF] corresponds to the data [FE], which is closest to the data [FF] in the function mode history.

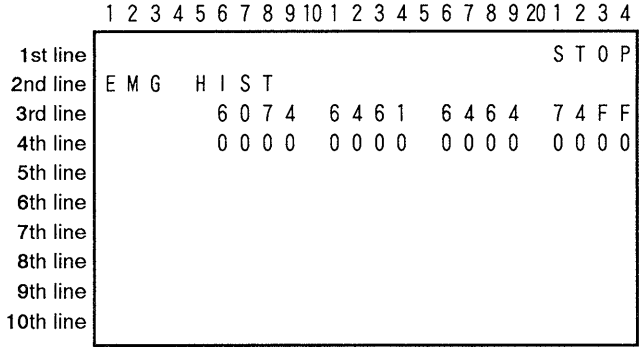

Fig. 8-4. Emergency History

According to the above example, as next to [FF] is the left edge 60, it can be seen that the emergency occurred in the following order.

60 (Read-in detection)
→ 74 (Focus drop)
→ 64 (Minimum chapter detection)
→ 61 (Read-out detection)
→ 64 (Minimum chapter detection)

Mechanism Mode

The mechanism mode is the basic operation mode in the mechanism controller. The codes are more or less the same as the function mode, but divided more in detail than the function mode.

The following is the mechanism mode list.

Table 8-5. Mechanism Mode List

No.	Function

2-4-5. [4] Trap Flag

Displays the contents of the trap flag.
The trap flag is data containing the reason why the power turned off abnormally other than when the POWER key was pressed.
Trap flag is output from the VFD controller and mode controller. That flag from the VFD controller is the fourth digit from the left and that from the mode controller is the fourth digit from the right.
The first byte of each from the right side (hexadecimal 2 digits) have meanings for each bit, and bit 1 corresponds to the reason why the power turned off abnormally the last time.
The first byte from the left side is the same flag, and is the logic OR of the reasons why the power turned off abnormally in the past.

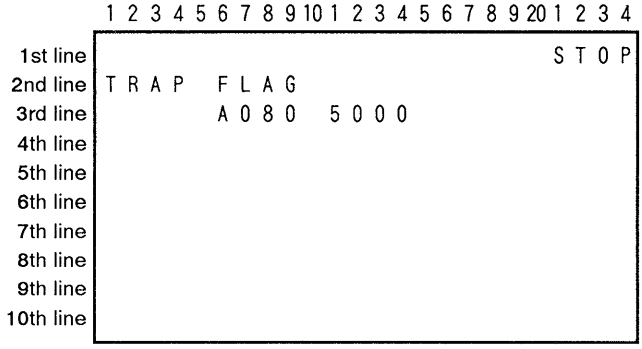

Fig. 8-6. Trap Flag

According to the above figure, it can be seen that in the past, 80 (power off due to abnormal voltage level) and 20 (power off due to mode controller communication error) occurred in the VFD controller, and 10 (power off due to mechanism controller communication error) and 40 (power off due to VFD controller communication error) occurred in the mode controller.
The reason why the power turned off abnormally the last time is because 80 (power off due to abnormal voltage level) occurred in the VFD controller.

The bits of the flag have the following meanings.

Table 8-6. Trap Flag Bit/Reason Table

Bit No. (Pattern)	Reason
7 (80)	Power OFF due to abnormal voltage level
6 (40)	Power OFF due to VFD controller communication error
5 (20)	Power OFF due to mode controller communication error
4 (10)	Power OFF due to mechanism controller communication error
3 (08)	Power OFF due to emergency
2 (04)	Forced power OFF due to key operations
1 (02)	Reset due to mode controller self-diagnosis
0 (01)	Forced reset due to key operations

Note:

- The resetting of bits 0 and 1 means that the mode controller is initialized in the same state as when the power was turned on, except when the trap flag is stored.
  In this case, the function mode and emergency histories will be erased.
- Hexadecimal A is 2+8. In the same way, B=1+2+8, C=4+8. D=1+4+8, C=2+4+8, F=-1+2+4+8.

2-4-6. [5] Key/remote Control Data

Displays the data input using the keys of the unit and remote control as CIRCS codes.
Only the remote control for MDP is effective.
The first byte on the left side of the third line (hexadecimal 2 digits) in Fig. 8-7 is the CIRCS code in the key inputs, and the first byte from the right side is the CIRCS code in the remote control input.
FF is set when nothing is pressed. When two keys are pressed together, the code of the one pressed faster will be shown.
In current models, only the keys of the unit can be used and some keys have no CIRCS code.
These are defined as internal codes for data above 80.

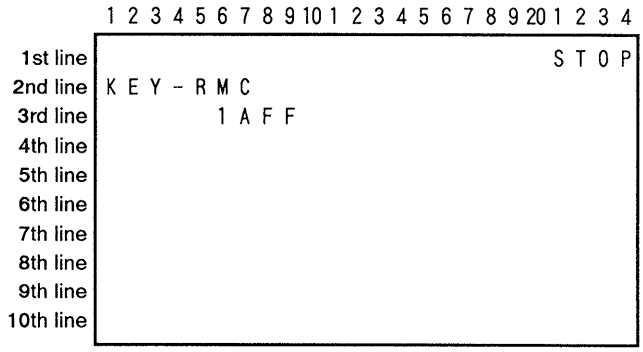

Fig. 8-7. Key/Remote Control Data

According to the above figure, it can be seen that the [1A (PLAY key)] of the unit is pressed, and the remote control is FF (nothing is pressed).
Take note for some remote controls, the code is generated instantaneously when the key is pressed.

The following next page shows a list of the CIRCS code used by MDP-V8K.

2-4-7. [7] Information on Communication with Mechanism Controller

Displays the communication data of normal text with the mechanism controller.

The third to the fifth line is the text transmitted from the mode controller to the mechanism controller.

The seventh to the ninth line is the text received from the mechanism controller by the mode controller.

The [!] symbol at the head of the eighth and ninth line indicates that the text has been communicated normally.

If the text was cut off halfway, the [?] is displayed. [■] is displayed when the communication was cut off after the communication for service, etc.

3. SERVICE MODE

3-1. Setting the Service Mode

To set the service mode, perform the following process.
With the power off, press the following three keys of the unit simultaneously and start up the power.
[STOP]+[KEY CONTROL #] + [POWER]

If the microprocessor version is displayed on the screen, it indicates that the service mode is set.
If it is not displayed, it indicates that the mode is not set.
When the service mode is set, the debug mode will also be set at the same time from the beginning.

3-2. Exiting the Service Mode

To exit, press POWER and turn off the power.
If it cannot be turned off (when the mechanism has not been completed, etc.), press the [1] key and [POWER] key of the unit simultaneously and turn off the power forcibly.

3-3. Using Special Operations

For safety, the special operations in the service mode can only be performed in the [NO DISC] and [STOP] state. Check that the above message is not blinking but displayed on the screen. If the [NEXT DISC RESERVE] key is pressed in this state, and after the FL tube goes off, keys of the unit such as [PLAY] and [PAUSE] are pressed, the special functions in Table 8-10 can be performed.

The sled forwarding operations using [SIDE A] and [SIDE B] keys are performed only when the keys are being pressed. Operations by other keys are continuously performed once the keys are pressed until the [STOP] key is pressed. The SIDE B LED of the unit is lit while special operations are being performed.
Several special operations cannot be performed at the same time even by pressing more than two keys together.

As some keys will not function while the FL tube is off, to stop special operations from being performed, press the [NEXT DISC RESERVE] key and light up the FL tube.

Table 8-10. List of Special Operations

Keys	Special Operations
[SIDE A]	Sled reverse direction (downwards) forwarding
[SIDE B]	Sled normal direction (upwards) forwarding
[PLAY]	Focus search start
[PAUSE]	Tilt servo ON start
[Normal direction frame forwarding]	Tray aging start
[Reverse direction frame forwarding]	Sled aging start
[Repeat AB]	Tilt aging start
[STOP]	Special operations are stopped

The following describe the special operations.

3-3-1. [SIDE A] Key····Sled Reverse Direction Forwarding

When the [SIDE A] key is pressed continuously, after the tilt initialization operations (the tilt is moved to the center position) are performed, the sled moves in the reverse direction (Side B inner circumference → Side B outer circumference → Side A outer circumference → Side A inner circumference).
It stops when the key is released.

3-3-2. [SIDE B] Key····Sled Normal Direction Forwarding

Opposite to 3-3-1. Sled Reverse Direction Forwarding, the sled moves in the normal direction (Side A inner circumference → Side A outer circumference → Side B outer circumference → Side B inner circumference).
Useful for replacing the optical parts.
The sled stops when the key is released.

3-3-3. [PLAY] Key····Focus Search

When the [PLAY] key is pressed continuously, focus search operations are repeated.
The pickup lens should move up and down.
Execute focus search after confirming that the sled is at the correct position (center of side A).
It stops when the [STOP] key is released.

3-3-4. [PAUSE] Key····Tilt Servo ON

When the [PAUSE] key is pressed, the tilt servo turns on.
When the [PAUSE] key is pressed after moving the sled to the center of side A by [SIDE A]/[SIDE B] key and placing the CD, etc. on the tray so that it touches the skew sensor, the tilt should move.
If the sled is moved using the [SIDE A]/[SIDE B] key, the tilt will return to the center.
It will stop when the [STOP] key is pressed.

3-3-5. [STILL/STEP ▮▮▶] Key····Tray Aging Start

When the [Still/STEP ▮▮▶] key is pressed, tray aging will start.
As the tray will move in and out automatically, be careful of the surrounding area.
It will stop when the [STOP] key is pressed.

3-3-6. [STILL/STEP ◀▮▮] Key····Sled Aging Start

When the [Still/STEP ◀▮▮] key is pressed, sled aging will start.
The sled will move to and fro between sides A and B inner circumferences automatically.
It will stop when the [STOP] key is pressed.

3-3-7. [REPEAT A ⟷ B] Key····Tilt Aging Start

When the [REPEAT A ⟷ B] key is pressed, tilt aging will start.
The tilt will move up and down automatically.
It will stop when the [STOP] key is pressed.

4. EXPANSION KEY FUNCTION

4-1. Using the Unit Simultaneous Key Pressing Function

The simultaneous key pressing function of the unit is effective when several keys of the unit are pressed simultaneously.

Used for functions to be executed promptly such as Forced Power OFF.
Currently defined simultaneous key pressing functions of the unit are as follows.

Table 8-11. Simultaneous Key Pressing Function of Unit

Function	Unit Key
① Forced power off Turns off the power forcible. To turn off the power immediately when the mechanism overruns, etc. or when the power cannot be turned off by pressing the [POWER] key. As the power will be turned off without regard of the conditions of the mechanism, do not use it frequently.	[1]+[POWER]
② Forced reset In addition to the forced power off function, initializes the mode controller. When the mode controller is operating abnormally such as strange items are displayed on the screen, use this function to reset the mode controller. When this function is executed, take note that emergency histories, and all information will be deleted other than the trap flag information of the debug mode.	[STOP]+[POWER]
③ MDP-V8 FL tube/all LEDs lighting up When the power turns on automatically, all the segments of the FL tube and LEDs will light up. Normal operations will be performed until the power is turned off. In such cases, the FL tube and LED displays will remain lit.	[STOP]+[KEY CONTROL ♭]+[POWER] (Only when the power is off.)

4-2. Using the Unit + Remote Control Simultaneous Key Pressing Function

The simultaneous key pressing function of the unit+remote control is effective while the unit key is pressed and a key of the remote control is pressed twice.

For users to execute it accidentally, it is necessary to press two remote commandeer keys within about 1 second.
To prevent the mechanism operations from being influenced, use the [NEXT DISC RESERVE] of the unit.
The special key operations currently set are as follows.

Table 8-12. Simultaneous Key Pressing Function of Unit Key Remote Control

Function	Procedure	Unit key + Remote control key
① Debug mode ON/OFF selection The debug mode is set if it has not been set, and is exited when it is set.	1 2	[NEXT DISC RESERVE]+[0] [NEXT DISC RESERVE]+[STOP]
④ Mechanism controller time-out invalidation Invalidates the function which cuts off the power supply when communication with the mechanism controller cannot be performed. Used when the mechanism controller may not be operating and the mode controller is to be moved.	1 2	[NEXT DISC RESERVE]+[0] [NEXT DISC RESERVE]+[+10]
⑤ Mechanism controller time-out validation Validates the function which cuts off the power supply when communication with the mechanism controller cannot be performed. Used for exiting the ④ function.	1 2	[NEXT DISC RESERVE]+[0] [NEXT DISC RESERVE]+[0]

NOTE:

The components identified by mark ⚠ or dotted line with mark ⚠ are critical for safety.
Replace only with part number specified.

When indicating parts by reference number, please include the board name.

- Due to standardization, replacements in the parts list may be different from the parts specified in the diagrams or the components used on the set.
- -XX, -X mean standardized parts, so they may have some difference from the original one.
- Items marked "*" are not stocked since they are seldom required for routine service. Some delay should be anticipated when ordering these items.
- RESISTORS
  All resistors are in ohms
  METAL: Metal-film resistor
  METAL OXIDE: Metal Oxide-film resistor
  F : nonflammable
- SEMICONDUCTORS
  In each case, u: μ , for example:
  uA...: μA..., uPA...: μPA..., uPB...: μPB..., uPC...: μPC..., uPD...: μPD...
- CAPACITORS
  uF : μF
- COILS
  uH : μH
- Abbreviation
  HK : Hong Kong model
  CH : Chinese model
  JE : Tourist model
